   - The training sample.
   - Applications.
3. Final Remarks.

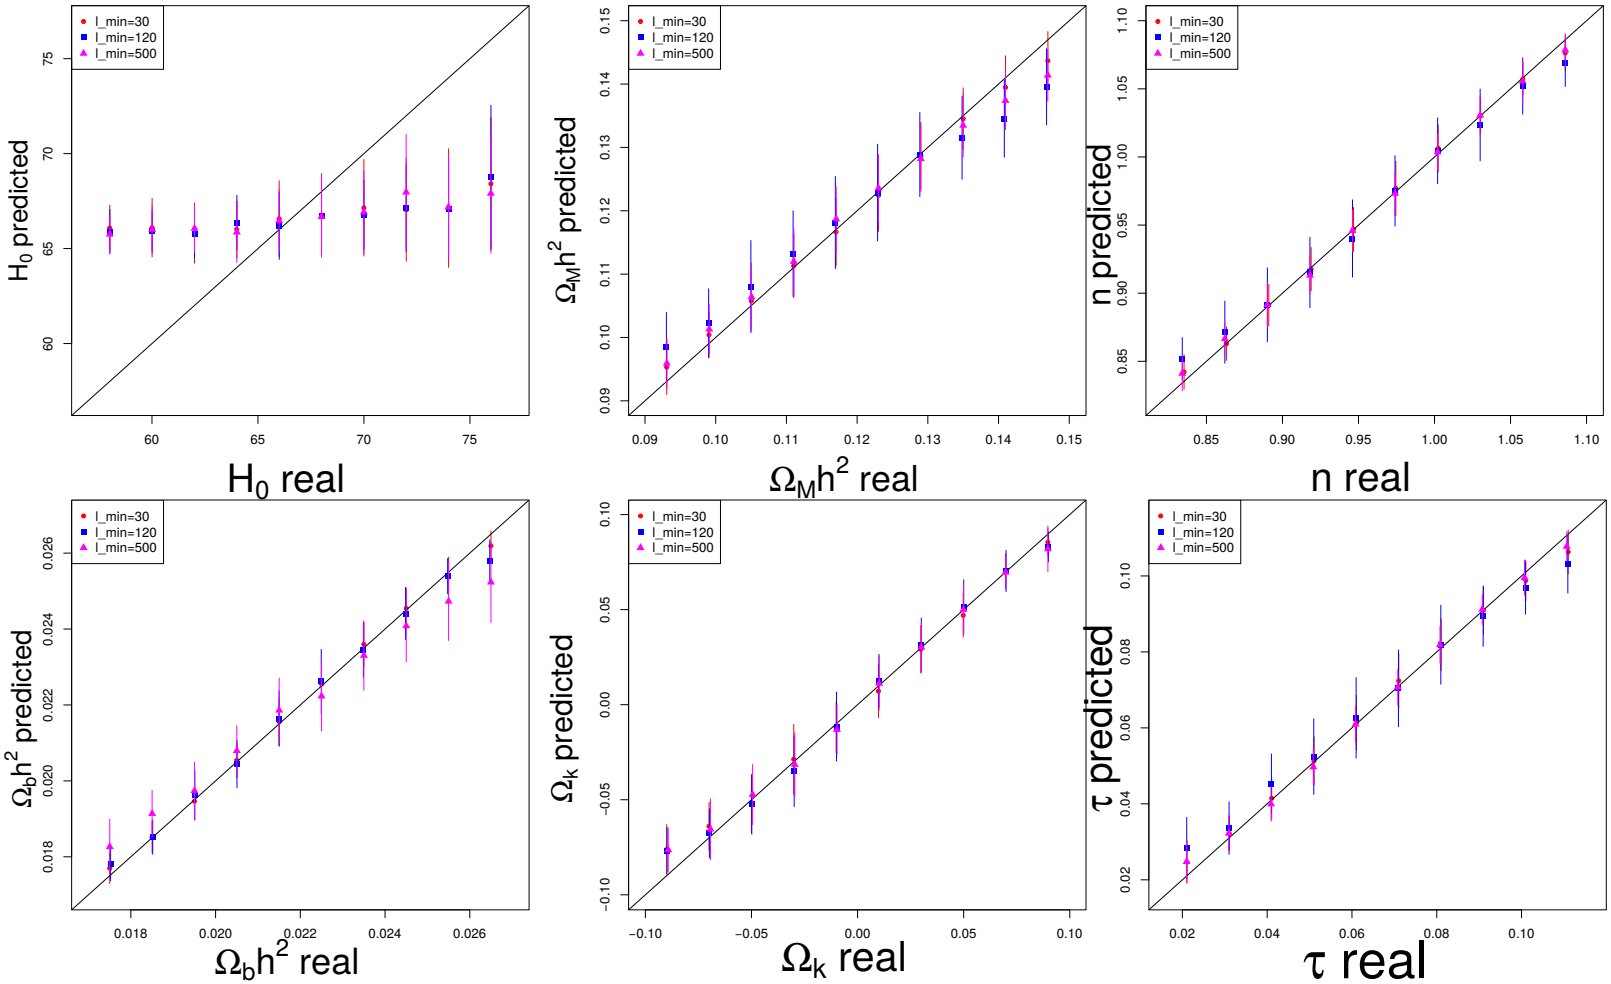
Final Remarks

- We developed a machine learning technique that estimate the cosmological parameters using CMB information.
- This technique can be easily extended to use more cosmological information as features (BAO, correlation function, SZ emission, etc.).
- As a first application we are studying the angular distribution of the cosmological parameters.
- We developed a machine learning technique that reconstructed the power spectra from pixels.
- We do not found any significant curvature departure from what is expected in an homogeneous and isotropic universe, with the exception of some pixels that are in the galactic plane.
- We will extend the parameters space and add polarization information.

THANK YOU!!


Changing the minimum mutipole.
